

FEATURES

- High common-mode transient immunity: 100 kV/ μ s
- High robustness to radiated and conducted noise
- Low propagation delay: 13 ns maximum for 5 V operation,
15 ns maximum for 1.8 V operation
- 150 Mbps maximum data rate

Safety and regulatory approvals (pending)

- UL recognition: 5000 V rms for 1 minute per UL 1577
- CSA Component Acceptance Notice 5A
- VDE certificate of conformity
DIN V VDE V 0884-10 (VDE V 0884-10):2006-12
 $V_{IORM} = 849$ V peak
- 10,000 V peak surge/impulse voltage rating

CQC Certification per GB4943.1-2011

Low dynamic power consumption

1.8 V to 5 V level translation

High temperature operation: 125°C maximum

Fail-safe high or low options

8-lead/16-lead, RoHS compliant SOIC packages

Qualified for automotive applications

APPLICATIONS

General-purpose multichannel isolation

Industrial field bus isolation

Automotive systems

GENERAL DESCRIPTION

The ADuM220N/ADuM221N/ADuM225N/ADuM226N¹ are dual-channel digital isolators based on Analog Devices, Inc., iCoupler® technology. Combining high speed, complementary metal-oxide semiconductor (CMOS) and monolithic air core transformer technology, these isolation components provide outstanding performance characteristics superior to alternatives such as optocoupler devices and other integrated couplers. The maximum propagation delay is 13 ns with a pulse width distortion (PWD) of less than 3 ns at 5 V operation. Channel matching is tight at 3.0 ns maximum.

The ADuM220N/ADuM221N/ADuM225N/ADuM226N data channels are independent and are available in a variety of configurations with a withstand voltage rating of 5.0 kV rms (see the Ordering Guide). The devices operate with the supply voltage on either side ranging from 1.8 V to 5 V, providing compatibility with lower voltage systems as well as enabling voltage translation functionality across the isolation barrier. Unlike other optocoupler alternatives, dc correctness is ensured in the absence of input logic transitions. Two different fail-safe options are available, in which

FUNCTIONAL BLOCK DIAGRAMS

the outputs transition to a predetermined state when the input power supply is not applied or the inputs are disabled. The ADuM220N0 is pin compatible with the ADuM2210 RW-16 package. The ADuM220N1 is pin compatible with the ADuM2200 RW-16 package. The ADuM221N0 is pin compatible with the ADuM2211 RW-16 package. The ADuM221N1 is pin compatible with the ADuM2201 RW-16 package.

¹ Protected by U.S. Patents 5,952,849; 6,873,065; 6,903,578; and 7,075,329. Other patents are pending.

SPECIFICATIONS

ELECTRICAL CHARACTERISTICS—5 V OPERATION

All typical specifications are at $T_A = 25^\circ\text{C}$, $V_{DD1} = V_{DD2} = 5\text{ V}$. Minimum/maximum specifications apply over the entire recommended operation range of $4.5\text{ V} \leq V_{DD1} \leq 5.5\text{ V}$, $4.5\text{ V} \leq V_{DD2} \leq 5.5\text{ V}$, and $-40^\circ\text{C} \leq T_A \leq +125^\circ\text{C}$, unless otherwise noted. Switching specifications are tested with $C_L = 15\text{ pF}$ and CMOS signal levels, unless otherwise noted. Supply currents are specified with 50% duty cycle signals.

Table 1.

Parameter	Symbol	Min	Typ	Max	Unit	Test Conditions/Comments
SWITCHING SPECIFICATIONS						
Pulse Width	PW	6.6			ns	Within pulse width distortion (PWD) limit
Data Rate		150			Mbps	Within PWD limit
Propagation Delay	t_{PHL} , t_{PLH}	4.8	7.2	13	ns	50% input to 50% output
Pulse Width Distortion	PWD		0.5	3	ns	$ t_{PLH} - t_{PHL} $

Output Rise/Fall Time	t_R/t_F		2.5		ns	10% to 90%
Common-Mode Transient Immunity ⁶	$ CM_H $	75	100		kV/ μ s	$V_{ix} = V_{DDx}$, $V_{CM} = 1000$ V, transient magnitude = 800 V
	$ CM_L $	75	100		kV/ μ s	$V_{ix} = 0$ V, $V_{CM} = 1000$ V, transient magnitude = 800 V

¹ I_{Ox} is the Channel x output current, where x is A or B.

² V_{MH} is the input side logic high.

³ V_{ML} is the input side logic low.

⁴ V_i is the voltage input.

⁵ N0 refers to the ADuM220N0/ADuM221N0/ADuM225N0/ADuM226N0 models, and N1 refers to the ADuM220N1/ADuM221N1/ADuM225N1/ADuM226N1 models. See the Ordering Guide section.

⁶ $|CM_H|$ is the maximum common-mode voltage slew rate that can be sustained while maintaining the voltage output (V_O) > 0.8 V_{DDx} . $|CM_L|$ is the maximum common-mode voltage slew rate that can be sustained while maintaining V_O > 0.8 V. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

Table 2. Total Supply Current vs. Data Throughput

AC SPECIFICATIONS							
Output Rise/Fall Time	t _R /t _F		2.5		ns	10% to 90%	
Common-Mode Transient Immunity ⁶	CM _H	75	100		kV/μs	V _{Ix} = V _{DDx} , V _{CM} = 1000 V, transient magnitude = 800 V	
	CM _L	75	100		kV/μs	V _{Ix} = 0 V, V _{CM} = 1000 V, transient magnitude = 800 V	

¹ I_{Ox} is the Channel x output current, where x is A or B.

² V_{bH} is the input side logic high.

³ V_{bL} is the input side logic low.

⁴ V_i is the voltage input.

⁵ N0 refers to the ADuM220N0/ADuM221N0/ADuM225N0/ADuM226N0 models, and N1 refers to the ADuM220N1/ADuM221N1/ADuM225N1/ADuM226N1 models. See the Ordering Guide section.

⁶ |CM_H| is the maximum common-mode voltage slew rate that can be sustained while maintaining V_O > 0.8 V_{DDx}. |CM_L| is the maximum common-mode voltage slew rate that can be sustained while maintaining V_O > 0.8 V. The common-mode voltage slew rates apply to both rising and falling common-mode voltage edges.

Table 8. Total Supply Current vs. Data Throughput

Parameter	Symbol	1 Mbps			25 Mbps			100 Mbps			Unit

RECOMMENDED OPERATING CONDITIONS

Table 16.

Parameter	Symbol	Rating
Operating Temperature	T_A	-40°C to +125°C
Supply Voltages	V_{DD1}, V_{DD2}	1.7 V to 5.5 V
Input Signal Rise and Fall Times		1.0 ms

ABSOLUTE MAXIMUM RATINGS

$T_A = 25^\circ\text{C}$, unless otherwise noted.

Table 17.

Parameter	Rating
Storage Temperature (T_{ST}) Range	-65°C to $+150^\circ\text{C}$
Ambient Operating Temperature (T_A) Range	-40°C to $+125^\circ\text{C}$
Supply Voltages (V_{DD1} , V_{DD2})	-0.5 V to $+7.0\text{ V}$
Input Voltages (V_{IA} , V_{IB})	-0.5 V to $V_{DD1} + 0.5\text{ V}$
Output Voltages (V_{OA} , V_{OB})	-0.5 V to $V_{DD2} + 0.5\text{ V}$
Average Output Current per Pin ³	
Side 1 Output Current (I_{O1})	-10 mA to $+10\text{ mA}$
Side 2 Output Current (I_{O2})	-10 mA to $+10\text{ mA}$
Common-Mode Transients ⁴	$-150\text{ kV}/\mu\text{s}$ to $+150\text{ kV}/\mu\text{s}$

¹ V_{DD1} is the input side supply voltage.

² V_{DD2} is the output side supply voltage.

³ See Figure 5 or Figure 6 for the maximum rated current values for various temperatures.

⁴ This term refers to the common-mode transients across the insulation barrier. Common-mode transients exceeding the absolute maximum ratings may cause latch-up or permanent damage.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

Table 18. ADuM220N/ADuM221N Maximum Continuous Working Voltage¹

Parameter	Rating	Constraint
AC Voltage		
Bipolar Waveform		
Basic Insulation	849 V peak	50-year minimum insulation lifetime
Reinforced Insulation	767 V peak	Lifetime limited by package creepage maximum approved working voltage per IEC 60950-1 ²
Unipolar Waveform		
Basic Insulation	1698 V peak	50-year minimum insulation lifetime
Reinforced Insulation	885 V peak	Lifetime limited by package creepage maximum approved working voltage per IEC 60950-1 ²
DC Voltage		Lifetime limited by package creepage maximum approved working voltage per IEC 60950-1 ²
Basic Insulation	1092 V peak	
Reinforced Insulation	543 V peak	

¹ Maximum continuous working voltage refers to the continuous voltage magnitude imposed across the isolation barrier. See the Insulation Lifetime section for more details.

² Insulation lifetime for the specified test condition is greater than 50 years.

Table 19. ADuM225N/ADuM226N Maximum Continuous Working Voltage¹

Parameter	Rating	Constraint
AC Voltage		
Bipolar Waveform		
Basic Insulation	849 V peak	50-year minimum insulation lifetime
Reinforced Insulation	789 V peak	Lifetime limited by package creepage maximum approved working voltage per IEC 60950-1 ²
Unipolar Waveform		50-year minimum insulation lifetime
Basic Insulation	1698 V peak	
Reinforced Insulation	849 V peak	
DC Voltage		Lifetime limited by package creepage maximum approved working voltage per IEC 60950-1 ²
Basic Insulation	1118 V peak	
Reinforced Insulation	558 V peak	

¹ Maximum continuous working voltage refers to the continuous voltage magnitude imposed across the isolation barrier. See the Insulation Lifetime section for more details.

² Insulation lifetime for the specified test condition is greater than 50 years.

Truth Table**Table 20. ADuM220N/ADuM221N/ADuM225N/ADuM226N Truth Table (Positive Logic)**

V_{ix} Input^{1, 2}	V_{DDI} State²	V_{DDO} State²	Default Low (N0), V_{Ox} Output^{1, 2, 3}	Default High (N1), V_{Ox} Output^{1, 2, 3}	Test Conditions/ Comments
Low	Powered	Powered	Low	Low	Normal operation
High	Powered	Powered	High	High	Normal operation
X ⁴	Unpowered	Powered	Low	High	Fail-safe output
X ⁴	Powered	Unpowered	Indeterminate	Indeterminate	Fail-safe output

¹ X means don't care.

² V_{ix} and V_{Ox} refer to the input and output signals of a given channel (A or B). V_{DDI} and V_{DDO} refer to the supply voltages on the input and output sides of the given channel, respectively.

³ N0 refers to the ADuM220N0/ADuM221N0/ADuM225N0/ADuM226N0 models, and N1 refers to the ADuM220N1/ADuM221N1/ADuM225N1/ADuM226N1 models. See the Ordering Guide section.

⁴ Input pins (V_{ix}) on the same side as an unpowered supply must be in a low state to avoid powering the device through its ESD protection circuitry.

PIN CONFIGURATIONS AND FUNCTION DESCRIPTIONS

NOTES

1. NIC = NO INTERNAL CONNECTION.
2. PIN 1 AND PIN 7 ARE INTERNALLY CONNECTED, AND CONNECTING BOTH TO GND₁ IS RECOMMENDED.
3. PIN 9 AND PIN 16 ARE INTERNALLY CONNECTED, AND CONNECTING BOTH TO GND₂ IS RECOMMENDED.

THEORY OF OPERATION

OVERVIEW

The ADuM220N/ADuM221N/ADuM225N/ADuM226N use a high frequency carrier to transmit data across the isolation barrier using *i*Coupler chip scale transformer coils separated by layers of polyimide isolation. Using an on/off keying (OOK) technique and the differential architecture shown in Figure 17 and Figure 18, the ADuM220N/ADuM221N/ADuM225N/ADuM226N have very low propagation delay and high speed. Internal regulators and input/output design techniques allow logic and supply voltages over a wide range from 1.7 V to 5.5 V, offering voltage translation of 1.8 V, 2.5 V, 3.3 V, and 5 V logic. The architecture is designed for high common-mode transient immunity and high immunity to electrical noise and magnetic interference. Radiated emissions are minimized with a spread spectrum OOK carrier and other techniques.

Figure 17 illustrates the waveforms for models of the ADuM220N/ADuM221N/ADuM225N/ADuM226N that have the condition of the fail-safe output state equal to low, where the carrier waveform is off when the input state is low. If the input side is off or not operating, the fail-safe output state of low (ADuM220N0/ADuM221N0/ADuM225N0/ADuM226N0 models) sets the output to low. For the ADuM220N/ADuM221N/ADuM225N/ADuM226N that have a fail-safe output state of high, Figure 18 illustrates the conditions where the carrier waveform is off when the input state is high. When the input side is off or not operating, the fail-safe output state of high (ADuM220N1/ADuM221N1/ADuM225N1/ADuM226N1) sets the output to high. See the Ordering Guide for the model numbers that have the fail-safe output state of low or the fail-safe output state of high.

APPLICATIONS INFORMATION

PCB LAYOUT

The ADuM220N/ADuM221N/ADuM225N/ADuM226N digital isolators require no external interface circuitry for the logic interfaces. Power supply bypassing is strongly recommended at the input and output supply pins (see Figure 19 and Figure 20). For the ADuM225N/ADuM226N, bypass capacitors are most conveniently connected between Pin 1 and Pin 4 for V_{DD1} and between Pin 5 and Pin 8 for V_{DD2} . For the ADuM220N/ADuM221N, bypass capacitors are most conveniently connected between Pin 1 and Pin 3 for V_{DD1} and between Pin 14 and Pin 16 for V_{DD2} . The recommended bypass capacitor value is between 0.01 μF and 0.1 μF . The total lead length between both ends of the capacitor and the input power supply pin must not exceed 10 mm. For the ADuM220N/ADuM221N, bypassing between Pin 3 and Pin 7 and between Pin 9 and Pin 14 must also be considered, unless the ground pair on each package side are connected close to the package.

Figure 19. Recommended PCB Layout for ADuM220N/ADuM221N

Figure 20. Recommended PCB Layout for ADuM225N/ADuM226N

In applications involving high common-mode transients, ensure that board coupling across the isolation barrier is minimized. Furthermore, design the board layout such that any coupling that does occur equally affects all pins on a given component side. Failure to ensure this can cause voltage differentials between pins exceeding the Absolute Maximum Ratings of the device, thereby leading to latch-up or permanent damage.

See the AN-1109 Application Note for board layout guidelines.

PROPAGATION DELAY RELATED PARAMETERS

Propagation delay is a parameter that describes the time it takes a logic signal to propagate through a component. The propagation delay to a Logic 0 output may differ from the propagation delay to a Logic 1 output.

Figure 21. Propagation Delay Parameters

Pulse width distortion is the maximum difference between these two propagation delay values and is an indication of how accurately the timing of the input signal is preserved.

Channel matching is the maximum amount the propagation delay differs between channels within a single ADuM220N/ADuM221N/ADuM225N/ADuM226N component.

Propagation delay skew is the maximum amount the propagation delay differs between multiple ADuM220N/ADuM221N/ADuM225N/ADuM226N components operating under the same conditions.

JITTER MEASUREMENT

Figure 22 shows the eye diagram for the ADuM220N/ADuM221N/ADuM225N/ADuM226N. The measurement was taken using an Agilent 81110A pulse pattern generator at 150 Mbps with pseudorandom bit sequences (PRBS) $2(n - 1)$, $n = 14$, for 5 V supplies. Jitter was measured with the Tektronix Model 5104B oscilloscope, 1 GHz, 10 GSPS with the DPOJET jitter and eye diagram analysis tools. The result shows a typical measurement on the ADuM220N/ADuM221N/ADuM225N/ADuM226N with 380 ps p-p jitter.

INSULATION LIFETIME

All insulation structures eventually break down when subjected to voltage stress over a sufficiently long period. The rate of insulation degradation is dependent on the characteristics of the voltage waveform applied across the insulation as well as on the materials and material interfaces.

The two types of insulation degradation of primary interest are breakdown along surfaces exposed to the air and insulation wear out. Surface breakdown is the phenomenon of surface tracking, and the primary determinant of surface creepage requirements in system level standards. Insulation wear out is the phenomenon where charge injection or displacement currents inside the insulation material cause long-term insulation degradation.

Surface Tracking

Surface tracking is addressed in electrical safety standards by setting a minimum surface creepage based on the working voltage, the environmental conditions, and the properties of the insulation material. Safety agencies perform characterization testing on the surface insulation of components that allows the components to be categorized in different material groups. Lower material group ratings are more resistant to surface tracking and, therefore, can provide adequate lifetime with smaller creepage. The minimum creepage for a given working voltage and material group is in each system level standard and is based on the total rms voltage across the isolation, pollution degree, and material group. The material group and creepage for the [ADuM220N/ADuM221N/ADuM225N/ADuM226N](#) isolators are presented in Table 9 and Table 10.

Insulation Wear Out

The lifetime of insulation caused by wear out is determined by its thickness, material properties, and the voltage stress applied. It is important to verify that the product lifetime is adequate at the application working voltage. The working voltage supported by an isolator for wear out may not be the same as the working voltage supported for tracking. It is the working voltage applicable to tracking that is specified in most standards.

Testing and modeling show that the primary driver of long-term degradation is displacement current in the polyimide insulation causing incremental damage. The stress on the insulation can be broken down into broad categories, such as dc stress, which causes very little wear out because there is no displacement current, and an ac component time varying voltage stress, which causes wear out.

The ratings in certification documents are usually based on 60 Hz sinusoidal stress because this reflects isolation from line voltage. However, many practical applications have combinations of 60 Hz ac and dc across the barrier as shown in Equation 1. Because only the ac portion of the stress causes wear out, the equation can be rearranged to solve for the ac rms voltage, as is shown in Equation 2. For insulation wear out with the polyimide materials used in these products, the ac rms voltage determines the product lifetime.

$$V_{RMS} = \sqrt{V_{AC\ RMS}^2 + V_{DC}^2} \quad (1)$$

or

$$V_{AC\ RMS} = \sqrt{V_{RMS}^2 - V_{DC}^2} \quad (2)$$

where:

V_{RMS} is the total rms working voltage.

$V_{AC\ RMS}$ is the time varying portion of the working voltage.

V_{DC} is the dc offset of the working voltage.

Calculation and Use of Parameters Example

The following example frequently arises in power conversion applications. Assume that the line voltage on one side of the isolation is 240 V ac rms and a 400 V dc bus voltage is present on the other side of the isolation barrier. The isolator material is polyimide. To establish the critical voltages in determining the creepage, clearance and lifetime of a device, see Table 18 and Table 19 and the following equations.

Figure 23. Critical Voltage Example

The working voltage across the barrier from Equation 1 is

$$V_{RMS} = \sqrt{V_{AC\ RMS}^2 + V_{DC}^2}$$

$$V_{RMS} = \sqrt{240^2 + 400^2}$$

$$V_{RMS} = 466\text{ V}$$

This V_{RMS} value is the working voltage used together with the material group and pollution degree when looking up the creepage required by a system standard.

To determine if the lifetime is adequate, obtain the time varying portion of the working voltage. To obtain the ac rms voltage, use Equation 2.

$$V_{AC\ RMS} = \sqrt{V_{RMS}^2 - V_{DC}^2}$$

$$V_{AC\ RMS} = \sqrt{466^2 - 400^2}$$

$$V_{AC\ RMS} = 240\text{ V rms}$$

In this case, the ac rms voltage is simply the line voltage of 240 V rms. This calculation is more relevant when the waveform is not sinusoidal. The value is compared to the limits for the continuous working voltage in Table 18 and Table 19 for the expected lifetime, less than a 60 Hz sine wave, and it is well within the limit for a 50-year service life.

Note that the dc working voltage limits in Table 18 and Table 19 are set by the creepage of the package as specified in IEC 60664-1. These values can differ for specific system level standards.

AUTOMOTIVE PRODUCTS

The ADuM221N0WBRWZ, ADuM221N0WBRWZ-RL, ADuM226N0WBRIZ, and ADuM226N0WBRIZ-RL models are available with controlled manufacturing to support the quality and reliability requirements of automotive applications. Note that these automotive models may have specifications that differ from the commercial models; therefore, designers should review the Specifications section of this data sheet carefully. Only the automotive grade products shown are available for use in automotive applications. Contact your local Analog Devices account representative for specific product ordering information and to obtain the specific Automotive Reliability reports for these models.
